

Abstract

Printer, operation of a printer

5 The invention relates to a printer (2) and a method of
controlling a printer (2) in order to print out a report
relating to data recorded by a tachograph (1), the printer (2)
having a supply (9) of printing medium (10) and being equipped
with a medium transport device (15). In conventional printers
10 (2), printing medium (10) jams occur frequently, since the
latter bonds adhesively to a pressure roller (8), for example,
under the action of temperature fluctuations and atmospheric
humidity. Here, the invention provides a remedy in that, even
without the presence of a print job (6), rest state transport
15 of the printing medium (10) is carried out at periodically
repeating intervals.
